

Fineboring tools

Radial adjustment, μm -accurate adjustable

Additional design features:

Similar to the fineboring tools with tapered screw adjustment are the robust clamping element located in the chip flute, the large chip flutes and an internal coolant supply. These aforementioned design elements are responsible for an excellent chip evacuation even when long-chipping material is machined.

Based on our standard tools we also design and manufacture customer specific solutions for your individual machining requirements.

Please use our special tool inquiry sheet on page 130 for your convenience.

The radial fine adjustment with radial screw
