

Cartridges

with tapered screw adjustment, μm -accurate adjustable

The advantages of HOLLFELDER-GÜHRING cartridges:

Both cartridge and insert remain solidly fixed in the basic holder respectively in the pocket seat during the adjustment operation, the angle position of the insert remains unchanged, which is particularly of advantage for machining 90° shoulders. This type of assembly guarantees the best possible stability of the connection holder-cartridge.

Internal machining tools satisfying highest requirements in precision and quality can thus be produced with cartridges of HOLLFELDER-GÜHRING CUTTING TOOLS starting at a bore diameter of 20 mm already. For a table showing assembly measures and minimum diameters pls. refer to page 71.
